

Fig. 13 Shows the progress of the four sets of water toward the Bow Inlet.

The high wall of waters (that Moses and Israel passed through) which are just at the edge of the dried out crossing begin to return and flood first, as has been shown.

When those waters hit together there is somewhat of a back wave which tends to go back towards the Bitter Lakes to the North, and toward the Gulf of Suez to the South.

As the waters from the main wall of waters hit together and form the back wave they hit the next set of incoming waters from the Little Bitter Lake and from the top semicircular curved area just in front of the high mountain which Moses calls Migdol.

This is what appears to be occurring, but the exact timing and strength and sequence will have to be determined by further research and modeling, and simulations.
