

Fig. 14 At this time the Army is drowned and fallen to the bottom but a second and third waves follow.

The wave of waters returns from Great Bitter Lake and Little Bitter Lake to the North, and from the South from the Top of the Gulf of Suez and the area just to the south of the top.

Fig. 15 Left: Undercut sand river bank (Sand River, SC USA) shows effect of current and partial collapse of the bottom. (mirror image)

Fig. 16 Below: Undercut river banks, and river bank collapses, are not unusual but rather normal for rivers and inlets. Image shows collapse and full 'TOE' (geomorphology term).
